

Project Creation to Consultant Sourcing Workflow

Step	Actor	Workflow Stage	Action	System Status / Result
1	PM	Client Assigned to PM	Approved client is manually assigned to a PM by Admin.	Client appears in the assigned PM portal.
2	PM	Client Review	PM reviews the client profile, onboarding information, documents, and previous communications.	PM has sufficient context to begin client discussion.
3	PM	Client Discussion	PM communicates directly with the client through the portal.	PM gathers further details about the client's issue or requirement.
4	PM	PM Notes	PM records internal notes from the discussion.	Notes are saved against the client and/or future project record.
5	PM	Project Creation	PM creates a new project linked to the assigned client.	New project record is created in draft.
6	System PM / AI- assisted system	Project ID Generation	System generates a unique Project ID.	Project receives permanent internal reference.
7		Project Summary Creation	AI generates an initial project summary using the client profile, client request, PM notes, uploaded documents, and discussion data.	AI-generated project summary appears in the Project Creation Form.
8		Project Details Completion	PM completes project-specific fields: title, category, scope, objective, main problem, expected deliverable, deadline, confidentiality level, required expertise, required role, work mode, languages, and constraints.	Project information becomes sufficient for admin review.
9	PM	Submit Project	PM submits the project for Admin review.	Project status becomes "Pending Admin Review".
10	System	Admin Notification	System alerts Admin that a new project has been created and requires review.	Admin receives dashboard task / notification.
11	Admin	Admin Review	Admin reviews the project information submitted by the PM.	Admin decides whether the project is ready for consultant sourcing.
12	Admin	Request Clarification	If information is incomplete, Admin returns the project to PM with clarification questions.	Project status becomes "Needs PM Clarification".
13	PM	PM Clarification	PM adds missing information or amends project details.	Updated project returns to Admin for review.
14	Admin	Approve Consultant Sourcing	Admin approves the project for consultant sourcing.	Project status becomes "Approved for Consultant Sourcing".

15	Admin / AI-assisted system	Consultant-Facing Summary Draft	System generates a consultant-facing project opportunity summary.	Draft consultant-facing summary is created.
16	Admin	Summary Review	Admin reviews the consultant-facing summary for confidentiality, suitability, commercial sensitivity, and completeness.	Admin may edit, approve, or request PM input.
17	Admin	PM Input Request	If operational detail is missing, Admin sends the draft summary back to PM with questions or amendment requests.	Sourcing status becomes “PM Input Required”.
18	PM	PM Summary Amendment	PM reviews the consultant-facing summary and adds safe operational detail.	Updated draft returns to Admin.
19	Admin	Final Summary Review	Admin performs final review after PM input.	Summary is cleared for circulation.
20	Admin	Approve Summary for Circulation	Admin approves the consultant-facing project summary.	Summary becomes shareable with suitable consultants.
21	Admin / System	Internal Consultant Sourcing	Summary is shared with suitable approved consultants already onboarded on the ORR consultant platform.	Selected onboarded consultants receive opportunity notice.
22	Admin / System	External Consultant Sourcing	If required expertise is not available internally, a restricted summary may be sent to external consultants who are not yet onboarded.	External consultants receive controlled invitation to express interest or onboard.
23	Consultant / External Consultant	Expression of Interest	Consultant expresses interest, asks for clarification, accepts consideration, or declines.	Response is recorded.
24	Admin / PM	Consultant Selection	Admin and PM review consultant responses and suitability.	Preferred consultant or consultant team is selected.
25	Consultant	Project-Specific Compliance	Selected consultant confirms no conflict of interest and reconfirms confidentiality.	Consultant becomes eligible for controlled project access.
26	Admin / PM	Access Activation	Admin or PM activates access according to approved access level.	Consultant assignment becomes active.
27	System / PM	Live Project Summary Updates	As new material input is added, the PM is prompted to review whether the project summary needs amendment.	Project summary remains a live project brief.

Notes for Developer

Client profile must be visible to the assigned PM only, unless broader admin permissions apply.

PM should be able to view the client profile, uploaded documents, and client notes.

Portal should support PM-client messaging and PM internal notes.

Internal PM notes must not be visible to the client unless specifically marked as client-facing.

Each client can have multiple projects. Each project must have its own Project ID and remain linked to the same Client ID.

Suggested format: ORR-PROJ-000001.

PM must be able to review, amend, and approve the summary before submission. Store AI draft and PM-approved version.

The Project Creation Form should capture consultant requirements but should not directly assign consultants.

Admin must be notified automatically.

Notification should include Project ID, Client ID, PM, project title, category, urgency, and deadline.

Admin should review scope, confidentiality, commercial sensitivity, consultant requirements, payment status, and completeness.

PM should receive a notification and be able to amend the project record.

Maintain version history of major changes.

Consultant selection should not begin before this status is reached.

Summary should be based on approved project data and must exclude restricted client information unless authorised.

Summary must not be shared automatically.

This ensures the PM can add detail because the PM holds client/project context.

PM may clarify scope, expertise required, expected output, deadline, constraints, and non-confidential client context. Admin confirms no restricted information is disclosed.

Store approved summary and version history.

Matching may use specialization, skills, proficiency, availability, sector experience, language, work mode, geography, and admin rating.

External version must exclude confidential client details, documents, project workspace access, and sensitive commercial information.

No client documents or project workspace access should be granted at this stage.

Final selection should consider expertise, availability, conflicts, confidentiality level, cost, and project needs.

Required before any project material is released.

Access should be least-privilege: assignment brief only, selected documents only, full workspace, or restricted custom access.

Trigger review after material client messages, PM notes, uploaded documents, consultant notes, task updates, sub-task outcomes, deliverables, or scope changes. Preserve version history.
